

XXX

Guidelines

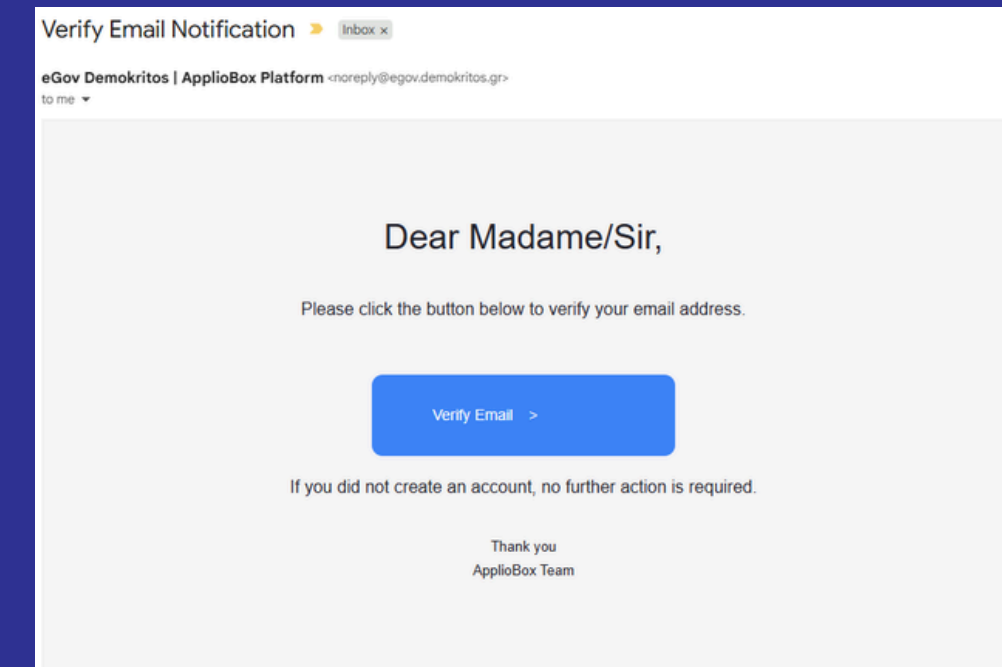

Getting Started

1. Find the email from applio box and click on register button

A registration form titled "Welcome". The text says: "Please register to gain access to your personalized dashboard, where you can manage your tasks, data, and much more. Your journey with applio box starts here, and we're excited to have you on board!". The form has three input fields: "Email" (containing "spherewebgr@gmail.com"), "Password", and "Retype Password". Below these fields is a blue button labeled "Register".

2. Create your password

3. Return to your email, find the verification mail and click on verify

4. Login to the platform

Proposal Title:
A new search method for particles of unknown masses in events with missing energy for the Large Hadron Collider

Proposal Acronym:
test

Primary Domain:
S.F.1 Natural Sciences

Proposal Abstract:
The discovery of Higgs Boson makes the arguments for the existence of new physics at the electroweak scale even stronger. The mass of the Higgs boson is lower than expected and a reasonable explanation could be the existence of new particles. Many BSM models predict a mirror world of new particles providing cancelation terms in the calculation of Higgs boson mass and thus explaining its low value. If these models also predict dark matter candidates, they often have as experimental signature a large missing energy (e.g Figure 1). The later originates from weakly interacting invisible particles that cannot be measured in the volume of our detectors. The physics motivation is even stronger as these invisible particles are often dark matter candidates. The experiments at the LHC have been looking for these particles from the beginning using missing energy related observables. The reason is that the reconstruction of the full event kinematics was considered impossible due to the presence of two invisible particles (dark matter candidates). In this proposal, the suggestion is to search for this still strongly motivated new physics in a different way, the one considered impossible: the multidimensional mass space, as bump hunting with all the advantages offered for robust discovery and interpretation.

Proposal Title:
Ex-Post Assessment of Nature-Based Soil and Water Conservation Measures on Primary Production and Aquifer Recharge in Mediterranean Agricultural Landscapes

Proposal Acronym:
test

Primary Domain:
S.F.7 Environment and Energy

Proposal Abstract:
This PhD research investigates the ex-post hydrological, agronomic, and socio-environmental effects of nature-based soil and water conservation measures, such as terraces, swales, and hedgerows, in Mediterranean agricultural landscapes. Focusing on two contrasting case studies in the Cyclades, Greece, and southern France, the project assesses how these structures affect primary production, soil moisture dynamics, runoff regulation, and aquifer recharge across varying climatic, geological, and land-management conditions. The study addresses a critical gap in Mediterranean research, where the benefits of terraced and conserved landscapes are often recognised but rarely quantified in integrated, multi-year, and comparative terms. By combining remote sensing, field surveys, interviews, historical reconstruction, and coupled hydrological modelling, the research will compare maintained, abandoned, restored, and removed conservation structures to disentangle the relative contributions of land management and climate variability. Beyond biophysical performance, the project also examines the social and historical dimensions of landscape persistence, including local knowledge, agricultural practices, and the cultural significance of terraced systems. The expected outcome is a stronger evidence base for evaluating when and where nature-based conservation measures can enhance resilience, sustain agricultural productivity, and support climate adaptation in vulnerable Mediterranean regions.
